

SL24P VENETIAN

KNOB

This is a magnetic system with manual control of blinds. The system has been designed in a way to enable the function of tilting the slats only using an external knob, which is attached to the window/door frame.

The internal magnetic unit that transfers the motion from the knob to the blinds is completely concealed and sealed within the insulated glass unit frame. This is to maintain the insulating properties of the insulated glass unit, particularly protection against dirt and weather conditions.

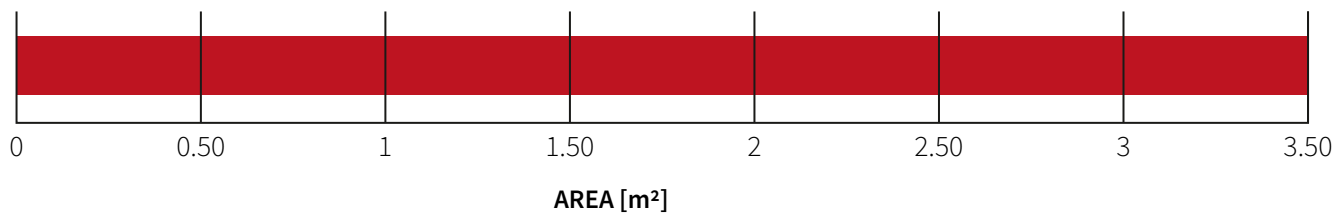

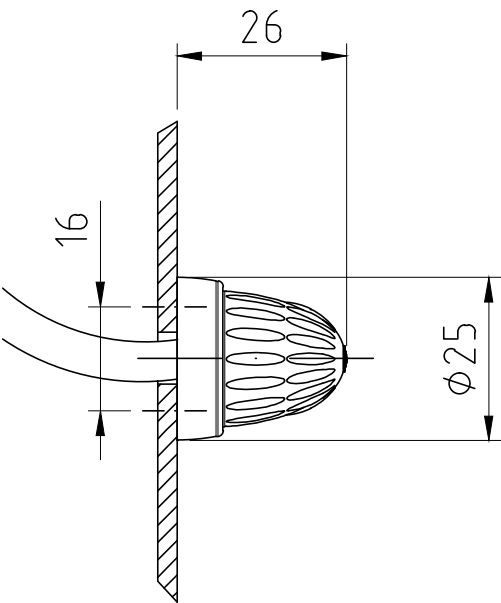

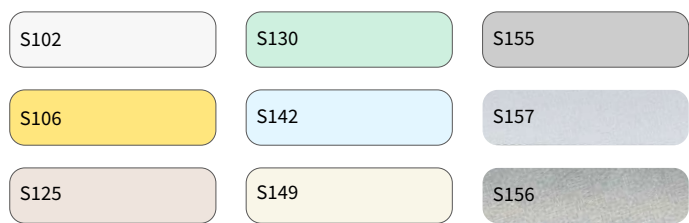

The SL24P system comes standard with a 24mm-wide warm spacer bar in either gray (RAL7035) or black (RAL9005).
